B-50

## Task 1

Task 1: Zero-Shot Prompting – Leap Year Check

Scenario

Zero-shot prompting involves giving instructions without providing examples.

Task Description

Use zero-shot prompting to instruct an AI tool to generate a Python function that:

- Accepts a year as input
- Checks whether the given year is a leap year
- Returns an appropriate result

Note: No input-output examples should be provided in the prompt.

Expected Output

- AI-generated leap year checking function
- Correct logical conditions
- Sample input and output
- Screenshot of AI-generated response (if required)

## Prompt:

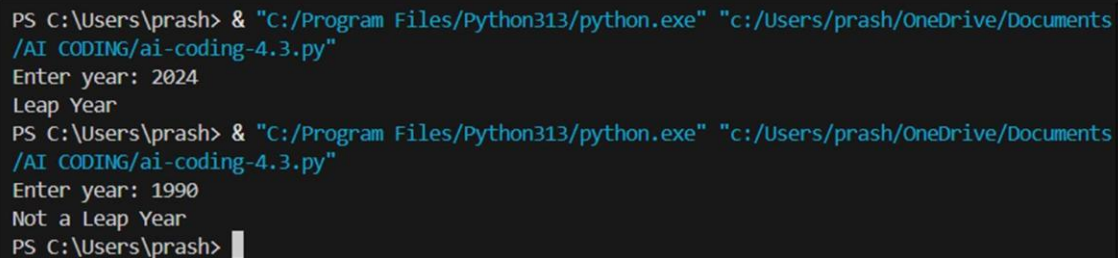

Generate a Python function that accepts a year as input, checks whether it is a leap year, and returns the result. Do not use examples.

## Code:

```
def check_leap_year(year):    if (year % 4 == 0 and year %  
100 != 0) or (year % 400 == 0):  
    return "Leap Year"  
else:  
    return "Not a Leap Year"
```

```
year = int(input("Enter year: "))  
print(check_leap_year(year))
```

## Output:

```
PS C:\Users\prash> & "C:/Program Files/Python313/python.exe" "c:/Users/prash/OneDrive/Documents  
/AI CODING/ai-coding-4.3.py"  
Enter year: 2024  
Leap Year  
PS C:\Users\prash> & "C:/Program Files/Python313/python.exe" "c:/Users/prash/OneDrive/Documents  
/AI CODING/ai-coding-4.3.py"  
Enter year: 1990  
Not a Leap Year  
PS C:\Users\prash> █
```

## Code Explanation:

This program checks whether a year is a leap year using standard leap year rules. A year must be divisible by 4 but not by 100 unless divisible by 400. Zero-shot prompting is used because no examples are given to the AI. The AI generates logic based only on instructions. This method works well for simple logical problems.

---

## Task 2

### One-Shot Prompting – Centimeters to Inches Conversion

#### Scenario

One-shot prompting guides AI using a single example.

#### Task Description

Use one-shot prompting by providing one input-output example to generate a Python function that:

- Converts centimeters to inches
  - Uses the correct mathematical formula
- Example provided in prompt:

Input: 10 cm → Output: 3.94 inches

#### Expected Output

- Python function with correct conversion logic
- Accurate calculation
- Sample test cases and outputs

## Prompt:

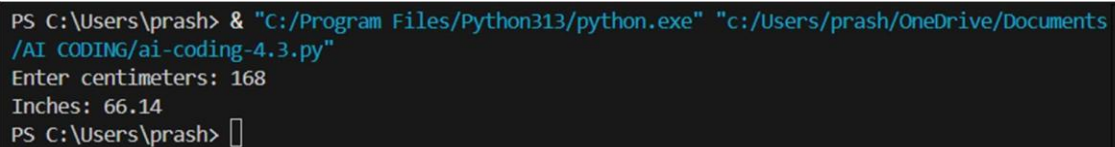

Generate Python function to convert centimeters to inches.

Example: 10 cm → 3.94 inches

## Code:

```
def cm_to_inches(cm):  
    return cm / 2.54  
  
cm = float(input("Enter centimeters: "))  
print("Inches:", round(cm_to_inches(cm), 2))
```

## Output:

```
PS C:\Users\prash> & "C:/Program Files/Python313/python.exe" "c:/Users/prash/OneDrive/Documents  
/AI CODING/ai-coding-4.3.py"  
Enter centimeters: 168  
Inches: 66.14  
PS C:\Users\prash>
```

## Code Explanation:

This program converts centimeters to inches using the formula  $\text{Inches} = \text{CM} / 2.54$ . One-shot prompting helps AI understand correct conversion using one example. This improves accuracy compared to zero-shot prompting.

---

## Task 3

### Few-Shot Prompting – Name Formatting

#### Scenario

Few-shot prompting improves accuracy by providing multiple examples.

#### Task Description

Use few-shot prompting with 2–3 examples to generate a Python function that:

- Accepts a full name as input
- Formats it as “Last, First”

#### Example formats:

- "John Smith" → "Smith, John"
- "Anita Rao" → "Rao, Anita"

#### Expected Output

- Well-structured Python function
- Output strictly following example patterns
- Correct handling of names
- Sample inputs and outputs

## Prompt:

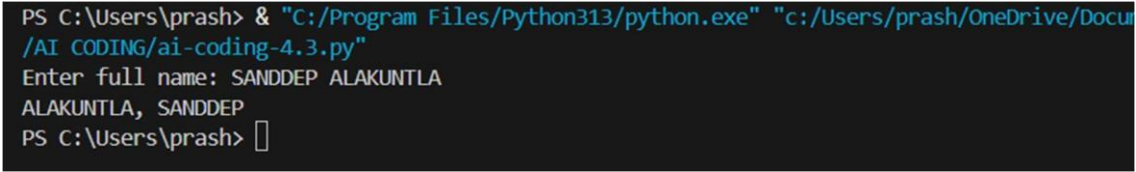

Generate Python function to format name as "Last, First". Examples: John Smith → Smith, John Anita Rao → Rao, Anita

## Code:

```
def
format_name(full_name):
    parts = full_name.split()
    first = parts[0]    last =
    parts[-1]    return f'{last},
{first}'

name = input("Enter full name: ")
print(format_name(name))
```

## Output:

```
PS C:\Users\prash> & "C:/Program Files/Python313/python.exe" "c:/Users/prash/OneDrive/Documents/AI CODING/ai-coding-4.3.py"
Enter full name: SANDDEP ALAKUNTALA
ALAKUNTLA, SANDDEP
PS C:\Users\prash>
```

## Code Explanation:

Few-shot prompting uses multiple examples, helping AI generate accurate formatting logic. The program splits the name and rearranges it into the required format.

---

## Task 4

Comparative Analysis – Zero-Shot vs Few-Shot

Scenario

Different prompt strategies may produce different code quality.

## Task Description

- Use zero-shot prompting to generate a function that counts vowels in a string
- Use few-shot prompting for the same problem
- Compare both outputs based on:
  - o Accuracy
  - o

Readability

- o

Logical clarity

## Expected Output

- Two vowel-counting functions
- Comparison table or short reflection paragraph
- Conclusion on prompt effectiveness

## Prompt:

Generate Python function to count vowels in a string.

## Code:

```
def
count_vowels_zero(text):
vowels = "aeiouAEIOU"
count = 0    for ch in text:
if ch in vowels:
count += 1    return count
```

## Code explanation:

Generate Python vowel count

function. Examples: Hello → 2

India → 3 Few-shot prompting produces cleaner and more optimized code because examples guide AI logic.

---

## Task 5

Few-Shot Prompting – File Handling

Scenario

File processing requires clear logical understanding.

### Task Description

Use few-shot prompting to generate a Python function that:

- Reads a .txt file
- Counts the number of lines in the file
- Returns the line count

### Expected Output

- Working Python file-processing function
- Correct line count
- Sample .txt input and output
- AI-assisted logic explanation

Note: Report should be submitted as a word document for all tasks in a single document with prompts, comments & code explanation, and output and if required, screenshots

### Prompt:

Generate Python function to read .txt file and count lines.

Example: sample.txt → 4 lines

### Code:

```
def count_lines(filename):  
    try:        with open(filename, "r")  
    as file:            return  
len(file.readlines()) except:  
    return "File not found"  
  
file_name = input("Enter file name: ")  
print("Total Lines:", count_lines(file_name))
```

### Output:

```
PS C:\Users\prash> python -u C:\Program Files\Python22\python.exe  
/AI CODING/ai-coding-4.3.py"  
Enter file name: sample.txt  
Total Lines: File not found  
PS C:\Users\prash>
```

## Code explanation:

Few-shot prompting helps AI understand file reading and counting logic using examples.  
The program safely opens the file and counts total lines.
